Dr. Lisa Dibler, OD

Over the years, our patients have come to expect state of the art care and eye care services at Dr. Dibler's practice. We are committed to providing quality eye care and the new technological innovations to our patients. As part of this commitment, we recommend the addition of **Digital Retinal Imaging** for our patients.

Many retinal conditions do not produce symptoms such as vision loss or pain. When detected early enough, many retinal problems can be treated to avoid vision loss. However, once a retinal problem has caused a loss in vision, it is almost never reversible. Early detection is vital to preserving good eye health.

Healthy Retina

Retinal Scarring

Prior to the **Digital Retinal Imaging**, there was no technology available that gave the doctor such an immediate, comprehensive view of your retina without dilating your eyes. With the **Digital Retinal Imaging**, it is possible to avoid dilation and detect retinal disease or record a healthy retinal exam with a digital photo/image.

Although there is no need for dilating drops with **Digital Retinal Imaging**, Dr. Dibler may need to dilate your eyes and examine them further using other methods if there is a medical indication.

Unfortunately, vision plans do not offer coverage for advanced diagnostic screening. However, in the case of existing eye disease which needs to be documented, most medical insurance plans will reimburse for this procedure as per your plan guidelines.

Our fee for screening **Digital Retinal Imaging** is \$39.

If you wish to forgo dilation and have **Digital Retinal Imaging** as an alternative, please let us know.

Please perform **Digital Retinal Imaging** as an optional procedure to my examination.

I do not wish to have baseline digital retinal imaging performed today.
